

Harrison Moss - IFSC 3342 - Mobile Web Final

Feedback and Takeaways

Feedback:

I feel like I got some pretty good feedback from the people I asked. The first person I asked was my aunt Alicia who works at the library. The majority of her feedback was making sure that the site felt fun and not super static. Originally, I believe my site was static. Afterwards, I put effort towards making it so that there are many hover elements and interactive text on the site so that it is fun to mess around with. She also wanted to maintain the site having their facebook feed on it which I made sure to do. She also liked that I was putting all of the content on a single page as many of their older users often struggle with page-swapping.

The next person I asked for suggestions was my mother, who is a front end developer. She told me to dial back some of the gradients on text for readability and to also make the nav elements buttons. Overall I think these were great suggestions, I was going way overboard with the color gradients and the navigation elements were kind of hard to read and didn't really resonate as nav menu buttons.

Additionally, I asked my father and sister for feedback. They gave me some minor feedback such as some color changes and such.

Takeaways:

I feel like this class was very beneficial to enriching my web design and development progression. I really increased my knowledge and proficiency with using CSS and styling design in general. I now feel fairly confident in utilizing grid to reach my desired website conclusion. I also now feel comfortable utilizing media queries to re-adjust my websites to adapt them to multiple screen sizes and configurations.

An unexpected, yet welcome, takeaway from this course was collaboration with my peers, particularly Isaac and Mason. I feel like I learned so much by just asking them questions

and working out issues I had with them. I feel as if being able to collaborate proliferated my general knowledge and understanding.

As for investigating further, I absolutely know that I need to get my hands dirty and mess around with html, css, and javascript more. I know that there is so much more that I can learn and implement in the future; I have only scratched the surface of the potential within css and javascript.

I definitely look forward to continuing to learn more about this field and getting to mess around with new and cool things!
